OIL & GAS DEVELOPMENT COMPANY LIMITED

INTERNSHIP REPORT

Summer Internship Programme – 2026

Projects Department

Internship Period

17 August 2026 – 11 September 2026

Submitted To

Oil & Gas Training Institute (OGTI)

Submitted By

Muneeb Mehmood

Acknowledgement

I would like to express my sincere gratitude to Oil & Gas Development Company Limited (OGDCL) for providing me with the opportunity to undertake a four-week internship in the Projects Department. The internship provided valuable exposure to the professional environment of a major oil and gas organization and enabled me to relate project-management concepts to practical industrial activities.

I am especially thankful to the officers and staff members who guided me throughout the internship, explained technical and managerial processes, facilitated departmental learning sessions, and shared practical knowledge about project development, procurement, documentation, data management and project evaluation.

The experience has significantly improved my understanding of multidisciplinary project environments and has provided practical insight into the coordination required among technical, commercial, procurement, financial, administrative and operational functions.

Executive Summary

This report presents the learning, observations and professional exposure gained during a four-week internship at Oil & Gas Development Company Limited (OGDCL) in the Projects Department from 17 August 2026 to 11 September 2026. The internship provided a multidisciplinary understanding of project activities in the oil and gas sector, with particular emphasis on project development, procurement, technical coordination, documentation, governance and project economics.

The internship began with an understanding of the organizational and departmental workflow through which technical and support functions interact. The learning covered Exploration, Seismic, Data, Land, Drilling, R&M/D, Process, Projects, Plant-related functions, Accounts, HR, Finance and SAP/ERP, together with the interaction of organizational functions with government and private-sector entities.

The Projects Department exposure included the concepts of EPCC (Engineering, Procurement, Construction and Commissioning) and PCC (Procurement, Construction and Commissioning), Terms of Reference (TOR), Scope of Work (SOW), project documentation, HSE requirements, Permit to Work (PTW), JSA/JHA, PPE, risk assessment, incident reporting and contractual concepts including liquidated damages.

Procurement learning covered PPRA and relevant PEC rules, regulations, terms and conditions and the four competitive bidding procedures studied during the internship: Single Stage–One Envelope, Single Stage–Two Envelope, Two Stage and Two Stage–Two Envelope. Practical exposure was also obtained to SAP-related project workflow, including preparation and understanding of a Purchase Requisition (PR).

The Exploration Department sessions provided exposure to the overall exploration workflow and the seismic process. The physical observation of an LTO (Linear Tape-Open) data-storage medium further demonstrated how raw seismic data can be stored and transferred before processing and interpretation.

The principal project case study was the Jhal Magsi South Compression Project. The final project sessions provided a comprehensive review of the project rather than focusing only on economics or forecasting. The discussion covered project background and need, scope and technical requirements, production decline and compression requirements, three compression options, procurement approaches, project economics, forecasting, CAPEX/OPEX, implementation considerations and the basis for evaluating alternatives. The project study also included scenario-based economic evaluation and consideration of a preferred direction subject to revised project economics.

The final day also included exposure to a JV-related meeting, providing an opportunity to observe professional interaction and coordination with an external joint-venture stakeholder. Overall, the internship strengthened my practical understanding of project integration, procurement, stakeholder coordination, cost and schedule management, risk awareness, documentation, data flow and technical-commercial decision-making.

17. Conclusion

18. Recommendations

1. Introduction

1.1 Background of the Internship

An internship provides an opportunity to bridge academic knowledge and professional practice. In Project Management, this connection is particularly important because project delivery requires the integration of technical knowledge with planning, procurement, cost, schedule, risk, contracts, stakeholder management, communication and organizational governance.

The four-week internship at OGDCL was undertaken in the Projects Department from 17 August 2026 to 11 September 2026. The internship provided structured exposure to the multidisciplinary environment of an oil and gas organization and allowed me to observe how project-related information is generated, evaluated, coordinated and converted into implementation decisions.

1.2 Purpose of the Report

The purpose of this report is to document the major learning activities undertaken during the internship, explain their professional significance, and analyze how the experience contributed to the development of practical Project Management competencies.

2. Internship Profile

Item	Details
Organization	Oil & Gas Development Company Limited (OGDCL)
Department	Projects Department
Internship Period	17 August 2026 – 11 September 2026
Duration	Four weeks
Intern	Muneeb Mehmood

The internship formally related to a four-week placement in the Projects Department. I reported and commenced the internship on 17 August 2026 and completed the four-week internship period on 11 September 2026.

3. Objectives of the Internship

- To gain practical exposure to project-management practices within the oil and gas sector.
- To understand the role and workflow of the Projects Department within a multidisciplinary organization.
- To understand how technical, commercial, procurement, financial and administrative functions interact during project development.
- To learn the purpose and application of EPCC, PCC, TOR and SOW in project environments.
- To understand public-sector procurement requirements and competitive bidding procedures under PPRA.
- To develop practical awareness of SAP-based project/procurement workflow and Purchase Requisition preparation.
- To understand the exploration and seismic workflow and the role of data storage and transfer.
- To study a real project case involving technical alternatives, procurement strategy, forecasting and project economics.
- To strengthen professional skills in documentation, communication, analysis, coordination and decision-making.

4. Projects Department and Organizational Exposure

4.1 Understanding the Organizational Workflow

An important early learning session involved a detailed explanation of the organizational workflow using a departmental process diagram. The assigned officer explained how major functions connect from the technical origin of an oil and gas opportunity through development, project execution and supporting organizational processes.

The workflow included Exploration, Seismic, Data, Land, Drilling, R&M/D, Process, Projects, Plant-related functions, Accounts, HR, Finance and SAP/ERP. The workflow also demonstrated interactions with government and private-sector entities and other organizational functions.

This learning was important because it showed that project management is fundamentally an integration function. A project manager must coordinate information, decisions, approvals, resources and deliverables across several specialist functions rather than treating each department as an isolated unit.

4.2 Project Examples and Delivery Structures

Project-related discussions provided exposure to examples such as KPD-TAY Compression, UCH Compression, Produced Water Disposal TAY/Sono-Lashari, Bettani Development, Sinjhoro Development Phase-II and Dakhni Compression. These examples illustrated different project requirements, execution arrangements and technical interfaces.

5. Project Management Concepts and Technical Learning

5.1 EPCC

EPCC stands for Engineering, Procurement, Construction and Commissioning. The concept was studied as a project delivery arrangement in which engineering and design activities are followed by procurement, construction and commissioning. Understanding this sequence helped demonstrate how technical design decisions become procurement packages, construction activities and ultimately an operational facility.

5.2 PCC

PCC stands for Procurement, Construction and Commissioning. The concept was discussed in relation to project execution where procurement is a central starting point before construction and commissioning activities. Comparing EPCC and PCC helped me understand how project scope and contracting structure influence responsibility allocation and project coordination.

5.3 Project Lifecycle

The internship reinforced the project lifecycle from identification of a requirement through planning, technical evaluation, procurement, execution, commissioning/operational transition and close-out. This provided a practical context for concepts studied academically in Project Management.

6. Terms of Reference (TOR) and Scope of Work (SOW)

6.1 Terms of Reference

The internship included learning about Terms of Reference (TOR) and how they define the purpose, requirements, responsibilities, deliverables and expected outcomes of a consultancy or professional assignment.

6.2 Sinjhoro Development Phase-II — Consultant Technical Evaluation

A detailed learning activity involved the TOR/SOW for Sinjhoro Development Phase-II concerning the hiring of a consultant for bids technical evaluation. The approximately 50-page Scope of Work was studied to understand how a professional technical assignment is structured.

The document covered the project background and objectives, scope of services, pre-bid/site visit and meeting requirements, technical bid evaluation, clarification processes, SAP Ariba, applicable codes and standards, legal and tender requirements, timelines, consultancy charges and payment terms, taxes, bonds, deliverables and preparation of the evaluation report.

The learning also covered contractor/consultant obligations, terms and conditions, provision, transportation and handling responsibilities, loss and damage responsibility, and risk allocation. This demonstrated the link between a scope document, procurement requirements, contract administration and project execution.

6.3 Project Management Significance

TOR and SOW documents provide a structured basis for defining expectations and evaluating whether proposed services meet project requirements. From a Project Management perspective, clarity in scope reduces ambiguity, supports procurement evaluation and provides a reference for monitoring deliverables.

7. Procurement Management: PPRA and PEC

7.1 PPRA and PEC Learning

The internship included study of the Public Procurement Regulatory Authority (PPRA) framework, including relevant rules, regulations, terms and conditions. Pakistan Engineering Council (PEC) rules, regulations and terms and conditions were also studied to understand the broader procurement and engineering environment.

7.2 Competitive Bidding Procedures Studied

Procedure	Learning Summary
Single Stage – One Envelope	A single submission containing the required bid information, suitable where the requirements can be clearly specified and evaluated through the prescribed procedure.
Single Stage – Two Envelope	Technical and financial proposals are submitted separately, allowing technical evaluation before financial comparison.
Two Stage	A staged procurement approach that allows technical requirements and proposals to be developed or clarified before final evaluation.

Two Stage – Two Envelope	Combines the staged approach with separate technical and financial submissions, providing additional control for complex requirements.

7.3 Project Management Relevance

Procurement decisions have direct effects on project cost, schedule, quality, risk and resource availability. The internship therefore helped me understand procurement as a core project-management function involving planning, compliance, evaluation, contracting and supplier/contractor coordination.

8. SAP and Purchase Requisition (PR) Workflow

The internship also included practical exposure to SAP/ERP-related project and procurement workflow. I was introduced to the process of preparing a Purchase Requisition (PR), which provided practical understanding of how a requirement is formally initiated within an enterprise system.

Working through the PR process demonstrated the importance of accurate descriptions, specifications, quantities, supporting information and organizational routing. It also showed how procurement requirements move from an identified need toward formal processing and subsequent procurement activities.

This experience connected classroom concepts of procurement and project controls with an actual enterprise workflow and improved my understanding of documentation discipline and process compliance.

9. Exploration Department and Exploration Process

The internship included a dedicated exposure session with the Exploration Department. The session provided an overview of the exploration process and explained how different technical activities contribute to the assessment of subsurface opportunities.

The learning covered the progression from exploration objectives and data acquisition through seismic information, data management, processing and interpretation, followed by technical evaluation and decision-making. The session helped demonstrate that exploration is a multidisciplinary process in which geological, geophysical and data inputs are integrated.

For a Project Management student, this was valuable because it showed how technical uncertainty and information quality at the exploration stage can influence subsequent project identification, scope development, resource requirements and investment decisions.

10. Seismic Process and LTO Data Storage

10.1 Seismic Process

The seismic session explained the overall seismic workflow and the role of seismic data in understanding subsurface structures. The process was discussed as a sequence involving data acquisition, recording and storage, data transfer, processing, quality control and interpretation for technical evaluation.

10.2 LTO Data-Storage Observation

A particularly useful practical observation was the physical examination of an LTO (Linear Tape-Open) data-storage medium. This helped me understand how large volumes of raw seismic information can be stored and transferred before processing.

The observation reinforced the importance of data integrity, information security, controlled data transfer and data availability in technical projects. It also demonstrated that effective project decisions depend on reliable technical information and appropriate data-management practices.

11. HSE and Contractual Learning

11.1 Health, Safety and Environment (HSE)

HSE was discussed as an essential component of project execution. The learning included Permit to Work (PTW), Job Safety Analysis/Job Hazard Analysis (JSA/JHA), Personal Protective Equipment (PPE), risk assessment and incident reporting.

The internship demonstrated that HSE is integrated with project management because unsafe work can result in incidents, work stoppages, schedule delays, additional costs, quality impacts and reputational consequences. Therefore, HSE requirements must be considered during planning, execution, monitoring and control.

11.2 Liquidated Damages

Liquidated damages (LD) were discussed as a contractual mechanism associated with delay and non-performance, subject to the specific terms and conditions of the contract. The topic helped me understand the relationship between contract administration, schedule performance and financial consequences.

12. Jhal Magsi South Compression Project — Comprehensive Case Study

12.1 Introduction to the Case Study

The Jhal Magsi South Compression Project was the most detailed project-based learning activity of the internship. The departmental session provided a comprehensive explanation of the project using the project documents and related information studied during the internship.

The session was not limited to economics or forecasting. Those subjects were important components of the discussion, but the project was considered as a whole, including its background, need, scope, technical requirements, compression alternatives, procurement approaches, economic evaluation, forecasting and implementation considerations.

12.2 Project Need and Production Context

The project was considered in the context of production decline and the need for compression to support production from the relevant facilities. The discussion introduced the relationship between reservoir/field performance, pressure conditions, compression requirements, production sustainability and project timing.

12.3 Scope of Work and Project Requirements

The project documentation and presentation were used to understand the project's scope and the activities and facilities required to address the compression requirement. The discussion illustrated how a project scope is developed from an operational need and then translated into technical, procurement, implementation and commercial requirements.

12.4 Three Compression Options

Compression Option	Description
Option A — BOOT	A Build–Own–Operate–Transfer approach, involving an external party in development/ownership/operation under an agreed commercial and contractual structure.
Option B — Rental	Use of rented compressor capacity, particularly relevant where compression is needed on an interim or time-sensitive basis.
Option C — Self-Procurement	Direct procurement by OGDCL, providing direct ownership/control while requiring capital investment and responsibility for project execution.

The alternatives were discussed from multiple perspectives, including technical feasibility, timing, ownership, capital requirements, operating costs, contractual structure, implementation risk and long-term project value.

12.5 Economic Evaluation and Forecasting

Economic evaluation and production forecasting formed part of the wider project discussion. The analysis considered production assumptions, CAPEX, OPEX, cash flows and the effect of different implementation and procurement scenarios on project value.

Project-Study Indicator	Value Discussed
After-tax NPV	Approximately USD 5.84 million
IRR	Approximately 160%
Payback Period	Approximately 1.33 years
Consultancy Component	Approximately USD 114,500
CAPEX Discussed	Approximately USD 8 million

Note: The above values are presented as figures discussed during the internship study and are not represented as independently audited financial statements.

12.6 Scenario-Based Evaluation

The project evaluation involved considering changes in production, CAPEX, OPEX, cash flows, procurement timing and interim rental requirements. This demonstrated the value of scenario analysis in project decision-making. A project may appear attractive under one set of assumptions but require reassessment when costs, timing or production forecasts change.

12.7 Interim Rental and Long-Term Procurement

The project discussion considered the practical relationship between an interim rental solution and a longer-term procurement strategy. This illustrated the need to balance immediate operational requirements with long-term ownership, cost and project-value considerations.

12.8 Preferred Direction

Based on the information discussed during the project session, Option C emerged as the preferred direction at that stage, subject to review of revised project economics. This was an important learning point

because project decisions must remain responsive to updated technical, financial and operational information.

12.9 Implementation Roadmap

The project discussion also covered the broader implementation roadmap, extending from engineering and procurement through construction, commissioning/operational transition and project close-out. This demonstrated the need to maintain continuity between planning and execution and to manage interfaces throughout the project lifecycle.

12.10 Project Management Significance of the Case

The Jhal Magsi case study demonstrated how a project manager must integrate technical requirements, production forecasts, procurement strategy, cost, schedule, risk, stakeholder interests and economic value. It provided a real-world example of multidisciplinary decision-making rather than a single-discipline engineering exercise.

13. JV Meeting and Professional Exposure

On the final day of the internship, I also had the opportunity to observe a JV-related meeting. The meeting provided professional exposure to interaction and coordination with an external joint-venture stakeholder.

This experience demonstrated the importance of professional communication, preparation, structured discussion, clarification of requirements, stakeholder alignment and follow-up in external project relationships. It also reinforced the role of communication and stakeholder management in projects involving multiple organizations.

14. Project Management Analysis

Project Management Area	Practical Application Observed
Integration Management	Technical, procurement, financial, contractual and organizational inputs must be integrated to support coherent project decisions.
Scope Management	TOR, SOW and project documentation provide structured definitions of requirements, responsibilities and deliverables.
Schedule Management	Procurement lead times, interim rental requirements and implementation sequencing can materially affect project outcomes.
Cost Management	CAPEX, OPEX, cash flows and economic indicators influence the evaluation and selection of project alternatives.
Procurement Management	PPRA procedures, technical evaluation and procurement alternatives directly influence project delivery.
Risk Management	HSE risks, contractual risks, schedule risks, procurement risks and uncertainty in assumptions require active consideration.
Stakeholder Management	Departmental coordination and JV interaction require structured engagement with internal and external stakeholders.
Communications Management	Technical sessions, project documents, procurement documents and meetings demonstrate the importance of accurate information exchange.

Data Management	Seismic data storage, transfer and processing illustrate the role of reliable information in technical decision-making.
Decision-Making	Scenario analysis and revised economic assumptions demonstrate the need for evidence-based and adaptable decisions.

15. Skills and Competencies Developed

Competency	Development During Internship
Project Documentation	Improved ability to read and understand project-related documents, TORs, SOWs and supporting information.
Procurement Awareness	Developed practical understanding of procurement procedures, technical evaluation and procurement strategy.
Analytical Thinking	Improved ability to connect technical, operational and financial information when considering project alternatives.
Stakeholder Management	Developed greater awareness of cross-departmental coordination and external stakeholder interaction.
Commercial Awareness	Developed familiarity with CAPEX, OPEX, cash flows, NPV, IRR and payback as project evaluation concepts.
Data Management	Gained practical awareness of seismic data storage, transfer and information integrity.
Enterprise Systems	Gained exposure to SAP/ERP workflow and preparation of a Purchase Requisition.
Professional Communication	Improved ability to follow technical briefings, ask/understand project questions and observe formal meetings.
Risk Awareness	Improved understanding of HSE, contractual, schedule, procurement and economic risks.

16. Overall Internship Learning

The internship provided a broader understanding of Project Management as an integration and coordination function. I learned that project managers must work across technical, procurement, financial, contractual, operational and organizational interfaces. They do not necessarily perform every specialist task themselves, but they must understand the information produced by specialists and coordinate it toward project objectives.

The experience also showed that project decisions are dynamic. Changes in production forecasts, procurement timing, costs, operating requirements or other assumptions can require a project team to reassess alternatives. This was particularly evident in the Jhal Magsi South Compression Project case study.

The combination of technical sessions, procurement learning, SAP exposure, data-management observation and project case-study analysis provided a well-rounded practical understanding of project delivery in the oil and gas sector.

17. Conclusion

The four-week internship at Oil & Gas Development Company Limited in the Projects Department was a valuable professional learning experience. It provided practical exposure to the multidisciplinary environment in which oil and gas projects are planned, evaluated, procured, executed and transitioned toward operation.

The internship strengthened my understanding of EPCC, PCC, TOR, SOW, procurement procedures, PPRA and PEC requirements, SAP/PR workflow, exploration and seismic processes, LTO data storage, HSE, contractual considerations, stakeholder coordination and project documentation.

The Jhal Magsi South Compression Project case study was particularly significant because it demonstrated how technical need, scope, production forecasting, compression alternatives, procurement strategy, CAPEX, OPEX, economic evaluation and implementation planning are integrated into project decision-making. The JV meeting observed on the final day further added exposure to professional stakeholder interaction.

Overall, the internship enhanced my practical understanding of project integration, procurement, stakeholder management, risk awareness, cost and schedule considerations, technical-commercial analysis and professional communication. The experience has provided a strong foundation for applying Project Management knowledge in complex engineering and energy-sector projects.

18. Recommendations

1. Future internship programmes may benefit from a structured departmental rotation so interns can map the complete project lifecycle more systematically.
2. Selected non-confidential project documents may be provided for guided pre-reading before technical sessions to improve understanding of complex project discussions.
3. Greater practical exposure to project controls, including scheduling, cost tracking, progress monitoring and risk registers, would further strengthen the learning experience for Project Management interns.
4. Continued exposure to procurement and SAP-based workflows would help interns understand how project requirements are converted into formal organizational processes.
5. Cross-functional technical and managerial sessions should be maintained because they provide a realistic understanding of multidisciplinary project execution.
6. A structured daily learning log should be encouraged so interns can accurately document their learning and prepare a comprehensive final report.

Report Preparation Note

This final internship report has been prepared as a professional record of the learning and exposure obtained during the four-week internship. Confidential or restricted organizational information has not been reproduced. Project-specific financial figures are presented only as figures discussed during the internship and are not represented as independently audited financial statements.
